COMPOSITIONS AND METHODS FOR CONTROLLING
HARMFUL FUNGI

5

The present invention relates to compositions for controlling harmful fungi and to methods of controlling harmful fungi using such compositions.

- 10 It is known from the literature that active ingredients which inhibit the cytochrome bc₁ complex (cytochrome complex III) can be employed as fungicides [cf. U. Brandt, U. Haase, H. Schägger, G. von Jagow: "Spezifität und Wirkmechanismus der Strobilurine" [Specificity and mechanism of action of the strobilurins], Dechema monograph Vol. 129, 27-38, VCH Verlagsgesellschaft Weinheim, 1993; J.M. Clough: Natural Product Reports, 1993, 565-574; F. Rühl, H. Sauter: Biochem. Soc. Trans. 22, 635 (1993)].

- 20 However, when using these active ingredients, it has emerged that their action is only transitory, ie. new fungal growth was observed after only a short time.

EP-A-545 099 describes anilide compounds of the formula

25

30

- where A is phenyl which is substituted in the 2-position by methyl, trifluoromethyl, chlorine, bromine or iodine, or is one of certain aromatic or non-aromatic heterocyclic radicals which can be unsubstituted or substituted by methyl, chlorine or trifluoromethyl, and R is one of certain aliphatic or cycloaliphatic radicals which can be unsubstituted or substituted by halogen, or is phenyl which is unsubstituted or substituted by C₁-C₄-alkyl, C₁-C₄-alkoxy, C₁-C₄-alkylthio or halogen. These compounds can be used for controlling botrytis.

40

EP-A-589 301 describes anilide compounds of the same formula where A is a cyclic radical of the formulae:

45

15 where R^1 is hydrogen or C_1-C_4 -alkyl; R^2 is halogen or C_1-C_4 -alkyl; R^3 is C_1-C_4 -alkyl or C_1-C_4 -haloalkyl; n is 1 or 2; and R has essentially the abovementioned meanings. These compounds can also be used for treating botrytis.

20 WO 93/11117 describes compounds of the formula

35 where

- Q is C_1-C_3 -alkyl, C_2-C_3 -alkenyl, C_2-C_3 -alkynyl, $-(CH_2)_mCH=$ or $-(CH_2)_mX-CH_2$;
 n is 0 or 1;
 40 each m independently of the other is 0, 1, 2 or 3;
 each X independently is O or S;
 R^1 is one of certain alicyclic radicals;
 R^2 is hydrogen, fluorinated methyl, methyl, ethyl, C_2-C_6 -alkenyl, C_3-C_6 -chloroalkyl, phenyl, alkylthioalkyl, alkoxyalkyl, haloalkylthioalkyl, haloalkoxyalkyl or hydroxyalkyl;
 45 R^3 is halomethyl, halomethoxy, methyl, ethyl, halogen, cyano, methylthio, nitro, aminocarbonyl or aminocarbonylmethyl;

4/36140

R^4 is hydrogen, halogen or methyl;

R^5 , R^6 and R^7 in each case independently of one another are selected from amongst hydrogen, halogen, cyano, C_1 - C_6 -alkyl, C_2 - C_6 -alkenyl, C_2 - C_6 -alkynyl, C_1 - C_4 -alkoxy, C_1 - C_4 -alkylthio, C_3 - C_4 -cycloalkyl and halomethoxy. These compounds are

5 fungicidally active.

However, it has emerged that the abovementioned anilide compounds do not have a sufficiently broad and satisfactory spectrum of action.

It is an object of the present invention to provide an improved possibility of controlling harmful fungi, in particular botrytis.

10 Surprisingly, we have found that this object is achieved by a composition which comprises an active ingredient which inhibits respiration on cytochrome complex III in combination with an amide compound of the abovementioned type.

The present invention therefore relates to compositions for controlling harmful fungi which comprise, in a solid or liquid carrier,

15 A) at least one active ingredient I, which inhibits respiration on cytochrome complex III, of the formula

 $-C[COCH_2CH_3]=NOCH_3$, $-N(OCH_3)-CO_2CH_3$, $-N(CH_3)-CO_2CH_3$ or
 25 $-N(CH_2CH_3)-CO_2CH_3$

R'' has one of the following meanings:

- 10 where R^{Y} is alkyl;
 R^{S} is alkyl or phenyl which is unsubstituted or is substituted by 1, 2 or 3 halogen atoms; and R^{E} is alkyl or alkenyl; and

- a) at least one active ingredient I, which inhibits respiration on cytochrome complex III, and
- 15 b) at least one amide compound of the formula II

where

- 20 A is an aryl group or an aromatic or non-aromatic 5- or 6-membered heterocycle which has 1 to 3 hetero atoms selected from amongst O, N and S; it being possible for the aryl group or the heterocycle to be unsubstituted or to have 1, 2 or 3 substituents, independently of one another selected from amongst alkyl, halogen, CHF_2 , CF_3 , alkoxy, haloalkoxy, alkylthio, alkylsulfinyl and alkylsulfonyl;

- 30 by 1 or more halogen atoms, it being possible for the

4

aliphatic and cycloaliphatic radicals to be partially or fully halogenated and/or for the cycloaliphatic radicals to be substituted by 1 to 3 alkyl groups, and it being possible for the phenyl group, in turn, to have 1 to 5 halogen atoms and/or 1 to 3 substituents, independently of one another selected from amongst alkyl, haloalkyl, alkoxy, haloalkoxy, alkylthio and haloalkylthio, and it being possible for the amidic phenyl group to be fused to a saturated 5-membered ring which is unsubstituted or substituted by one or more alkyl groups and/or can have one hetero atom selected from amongst O and S, with the exception of the compound of the formula II where

A is 2-chloropyridin-3-yl, R¹ is H and R² is

The compositions according to the invention have a synergistic action and are therefore especially suitable for controlling harmful fungi, in particular botrytis. It is assumed that this is based on the fact that, when respiration on the cytochrome complex III is inhibited, the fungus utilizes a secondary route of alternative respiration, so that the fungi are not destroyed completely. This would mean that the amide compounds of the formula II inhibit the alternative respiration. It must therefore be assumed that the combination of the two active ingredients inhibits respiration via the cytochrome complex III and also the alternative respiration, so that the fungi are destroyed completely.

The preparation of the amide compounds of the formula I is disclosed, for example, in EP-A-545 099 or 589 301 or can be carried
30 out by similar processes.

To obtain the synergistic effect, the active ingredients are employed in a weight ratio in a range of from 20:1 to 1:20, in particular 10:1 to 1:10.

35 The invention also relates to a method of controlling harmful fungi, which comprises treating the fungi, their environment, or the materials, plants, seeds, soils, areas or spaces to be protected against fungal infection, with a composition as defined
40 above, it being possible for the active ingredients to be applied simultaneously, ie. jointly or separately, or in succession.

The compositions according to the invention can be applied, for example, in the form of directly sprayable solutions, powders, suspensions, also highly-concentrated aqueous, oily or other suspensions or dispersions, emulsions, oil dispersions, pastes, dusts, materials for spreading or granules by means of spraying, atomizing, dusting, spreading or pouring. The use forms depend on

M/36140

the intended purposes; in any case, they should guarantee the finest possible distribution of the active ingredients according to the invention.

- 5 Normally, the plants are sprayed or dusted with the active ingredients, or the seeds of the plants are treated with the active ingredients.

The formulations are prepared in a known manner, eg. by extending
10 the active ingredient with solvents and/or carriers, if desired using emulsifiers and dispersants, it also being possible to use other organic solvents as auxiliary solvents if water is used as the diluent. Auxiliaries which are suitable are essentially: solvents such as aromatics (eg. xylene), chlorinated aromatics (eg.
15 chlorobenzenes), paraffins (eg. mineral oil fractions), alcohols (eg. methanol, butanol), ketones (eg. cyclohexanone), amines (eg. ethanolamine, dimethylformamide) and water; carriers such as ground natural minerals (eg. kaolins, clays, talc, chalk) and ground synthetic minerals (eg. highly-dispersed silica, silicates);
20 emulsifiers, such as non-ionic and anionic emulsifiers (eg. polyoxyethylene fatty alcohol ethers, alkylsulfonates and arylsulfonates) and dispersants such as lignin-sulfite waste liquors and methylcellulose.

25 Suitable surfactants are the alkali metal, alkaline earth metal and ammonium salts of aromatic sulfonic acids, eg. ligno-, phenol-, naphthalene- and dibutyl-naphthalenesulfonic acid, and of fatty acids, of alkyl- and alkylarylsulfonates, of alkyl sulfates, lauryl ether sulfates and fatty alcohol sulfates; and salts of sulfated hexa-, hepta- and octadecanols, or else fatty

40 Powders, materials for spreading and dusts can be prepared by mixing or concomitantly grinding the active substances with a solid carrier.

45 Granules, eg. coated granules, impregnated granules and homogeneous granules, can be prepared by binding the active ingredients to solid carriers. Solid carriers are mineral earths, such as

M/36140

silica gel, silicas, silica gels [sic], silicates, talc, kaolin, limestone, lime, chalk, bole, loess, clay, dolomite, diatomaceous earth, calcium sulfate, magnesium sulfate, magnesium oxide, ground synthetic materials, fertilizers, such as ammonium sulfate, ammonium phosphate, ammonium nitrate, ureas, and products of vegetable origin, such as cereal meal, tree bark meal, wood meal and nutshell meal, cellulose powders or other solid carriers.

10 Examples of such preparations which comprise the active ingredients in a weight ratio of 1:1 are:

I. a solution of 90 parts by weight of the active ingredients and 10 parts by weight of N-methylpyrrolidone which is
15 suitable for use in the form of microdrops;

The compositions according to the invention are distinguished by an outstanding activity against a broad spectrum of phytopathogenic fungi, in particular against botrytis. Some of them act systemically (ie. they can be taken up by the treated plants without losing their activity and, if appropriate, translocated within the plant) and can be employed as foliar- and soil-acting fungicides.

They are particularly important for controlling a large number of fungi in a variety of crop plants such as wheat, rye, barley, oats, rice, maize, grass, cotton, soybeans, coffee, sugar cane, grapevine, fruit species, ornamentals and vegetable species such as cucumbers, beans and cucurbits, and on the seeds of these plants.

The compositions are applied by treating the fungi, or the seeds, plants, materials or the soil to be protected against fungal infection, with a fungicidally active amount of the active ingredients.

Application is effected before or after infection of the materials, plants or seeds with the fungi.

Specifically, the compositions are suitable for controlling the following plant diseases:

Erysiphe graminis (powdery mildew) in cereals,
Erysiphe cichoracearum and Sphaerotheca fuliginea in cucurbits,
Podosphaera leucotricha in apples,
Uncinula necator in grapevines,
Venturia inaequalis (scab) in apples,
Helminthosporium species in cereals,

Septoria nodorum in wheat,
Botrytis cinerea (gray mold) in strawberries and grapevines,
Cercospora arachidicola in groundnuts,

5 Pyricularia oryzae in rice,
Fusarium and Verticillium species in a variety of plants, Alternaria species in vegetables and fruit,

Sclerotinia species in oilseed rape and vegetables.

- 10 The use against botrytis is preferred.

The compositions can also be employed in the protection of material (protection of wood), for example against Paecilomyces variotii.

- 15
In general, the fungicidal compositions comprise from 0.1 to 95, preferably 0.5 to 90, % by weight of active ingredient.
- 20 Depending on the nature of the desired effect, the rates of application are from 0.02 to 3 kg of active ingredient per ha. In the treatment of seeds, amounts of from 0.001 to 50 g, preferably 0.01 to 10 g, of active ingredient are generally required per kilogram of seed.
- 25 In the use form as fungicides, the compositions according to the invention can also comprise other active ingredients, eg. herbicides, insecticides, growth regulators, fungicides or else fertilizers.
- 30 In many cases, a mixture with fungicides results in a widened fungicidal spectrum of action.

Activity against Botrytis cinerea on bell pepper fruits

Disks of green bell pepper fruits were sprayed to drip point with an aqueous preparation of the active ingredient comprising 80% of active ingredient and 20% of emulsifier in the dry matter. 2 hours after the spray coating had dried on, the fruit disks were inoculated with a spore suspension of Botrytis cinerea comprising 1.7×10^6 spores per ml of a 2% strength Biomalz solution. The inoculated fruit disks were subsequently inoculated [sic] for 4 days in humid chambers at 18°C. The botrytis development on the infected fruit disks was then evaluated visually (disease level 100%).

The visually determined values for the percentage of infected fruit area were converted into efficacies expressed in % of the untreated control. An efficacy of 0 is the same disease level as in the untreated control, an efficacy of 100 is a disease level of 0%. The expected efficacies for active ingredient combinations

- d) $CH_2ON=CR^cR^d-NOR^e$
where R^c is alkyl;
 R^d is alkyl or phenyl which is unsubstituted or is

substituted by 1, 2 or 3 halogen atoms; and
R' is alkyl or alkenyl; and

B) at least one amide compound of the formula II

where

A is one of the following groups:

pyridyl, thiazolyl, pyrazolyl or oxazolyl, it being possible for these groups to have 1, 2 or 3 substituents, independently of one another selected from amongst alkyl, halogen, difluoromethyl and trifluoromethyl,

R¹ is a hydrogen atom, alkyl or alkoxy;

R² is a phenyl or cycloalkyl group which has a phenyl substituent and wherein the phenyl substituent may have 1 to 5 halogen atoms and/or 1 to 3 alkyl substituents.
